

# Healthcare Dashboard Project Explanation

## Project Objective

The main objective of this project was to create an interactive Healthcare Dashboard to monitor hospital operations and patient service performance. The dashboard helps management track appointments, patient waiting time, doctor performance, and no-show rates in one place.

## Business Problem

The hospital management team was maintaining reports manually in Excel, which made reporting slow and difficult. They wanted a centralized dashboard to monitor total patients and appointments, department-wise waiting time, doctor performance, patient no-show trends, and overall operational efficiency.

## Tools & Technologies Used

- Power BI
- Excel / CSV Files
- Power Query
- DAX Functions

## Dataset Information

The dataset contains Patient Details, Appointment Records, Doctor Information, Department Data, Wait Time, and No-Show Status. I connected the data into Power BI and created relationships between tables.

## Data Cleaning & Transformation

Using Power Query, I removed null values, removed duplicate records, corrected data types, standardized department names, and created calculated columns for wait time and no-show risk.

## Dashboard KPIs

The dashboard includes important KPI cards such as Total Departments, Total Patients, Total Doctors, Total Appointments, and Average Wait Time. These KPIs help management quickly understand hospital workload and operational performance.

## Dashboard Visuals Explanation

1. Average Wait Time by Department helps identify overloaded departments.
2. Average Wait Time by No-Show Risk helps analyze whether long waiting times increase no-show probability.
3. Doctor Level Matrix provides doctor-wise performance analysis including appointments, consultation duration, no-show rate, and available hours.
4. No-Show Rate Gauge compares actual no-show percentage against target.

## Interactive Filters / Slicers

I added slicers for Doctor, Department, and Date so users can dynamically filter and analyze the dashboard.

## DAX Measures Used

### Average Wait Time

Avg Wait Time = AVERAGE(Appointments[Wait\_Time])

### No Show Rate

No Show Rate = DIVIDE(COUNTROWS(FILTER(Appointments, Appointments[Status]='No Show')),  
COUNTROWS(Appointments))

## **Business Impact**

This dashboard helps hospital management reduce patient waiting time, improve doctor scheduling, track no-show trends, improve operational efficiency, and make faster data-driven decisions.

## **Learnings from the Project**

Through this project, I improved my skills in Power BI Dashboard Design, Power Query, DAX Calculations, KPI Creation, Healthcare Data Analysis, and Interactive Report Development.

## **Interview Closing Statement**

This project helped me understand how Power BI can be used in the healthcare industry to improve operational efficiency and patient service management. I focused on creating a simple, interactive, and business-friendly dashboard so management could easily monitor hospital performance and take quick decisions.
